For eg “sachin” or ‘sachin’.

There are two variables- local and global.

For eg “sachin” or ‘sachin’

For eg-  $2+2$                       Here, 2 is integer and + is mathematical operator.

An expression is a construct which is made up of variables, operators, and method invocations, which are constructed according to the syntax of the language, that evaluates to a single value. Where a statement is a can be a line query. A expression can be a statement.

Ans6- `bacon=23`

Ans7- `'spam' + 'spamspam' - 'spamspamspam'`  
`'spam' * 3 - 'spamspamspam'`

Ans8- A variable can start with letters, words a-z ,A-Z. variable name can only contain alpha-numeric characters and underscores (A-z, 0-9, and `_` ) but it can't be started with any number.

Ans9- `int()` , `float()` , and `str()` functions will evaluate to the integer, floating-point number, and string versions of the value passed.

Ans10- `'I have eaten ' + 99 + ' burritos.'`

This is a error in which this shows only str can be concatenate with same data type that is str. Here I have eaten is str but 99 is int so it will show error.

Correct syntax is

`'I have eaten ' + '99' + ' burritos.'`
